

QA Automation and Manual Test Report

Date: June 26, 2026

Status: VERIFIED & RESOLVED

EXECUTIVE SUMMARY

During automated and manual end-to-end testing, two critical bugs were uncovered blocking customer custom-merchandise checkouts and producing constant console errors. These have been patched, validated locally, compiled cleanly for production, and pushed to origin.

1. Canvas Tote Bag Checkout Selector Block (Resolved)

Severity: High **Component: /custom-design Step 3 (Choose Product)**

Description: Initially, when selecting the Canvas Tote Bag, neither color (Natural/Black) was highlighted and the 'Continue to Mockup' button was disabled. Clicking 'Natural' directly did not register the selection, and 'Black' could only be selected if 'Natural' was clicked first.

Fix Implemented:

- Updated the product card onClick handler inside CustomDesign.tsx to automatically select the first enabled variant (Natural, 15" x 16") by default when the user clicks 'Canvas Tote Bag'. This immediately enables the 'Continue to Mockup' button.
- Standardized the variant title color matching and the selection highlights checks inside variantUtils.ts and CustomDesign.tsx to run case-insensitive and trimmed string comparisons, eliminating discrepancies.

2. Supabase Analytics CORS Preflight Failures (Resolved)

Severity: Medium **Component: useAnalytics hook**

Description: Every pageview triggered preflight request failures to Supabase analytics tables due to an uninitialized API key parameter ('apikey=undefined').

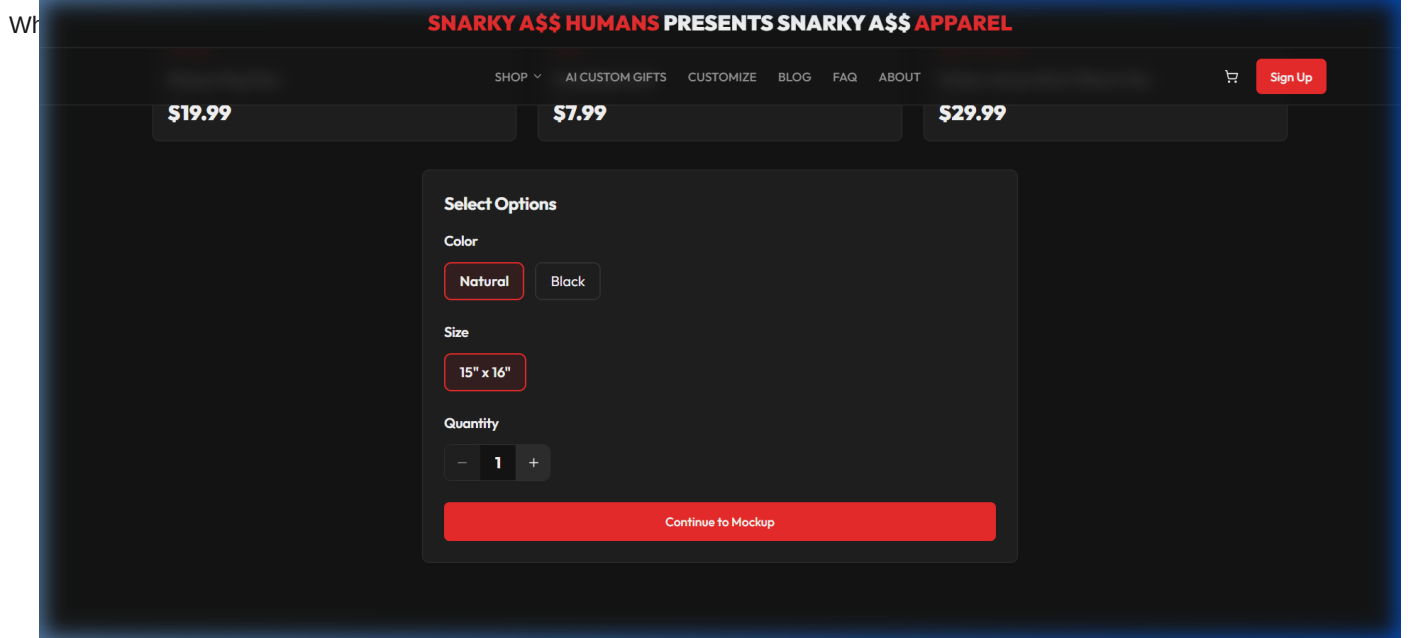

Fix Implemented:

- Replaced the reference to the undefined 'VITE_SUPABASE_ANON_KEY' inside the useAnalytics.ts sendBeacon helper with the correct client publishable key: 'VITE_SUPABASE_PUBLISHABLE_KEY'.

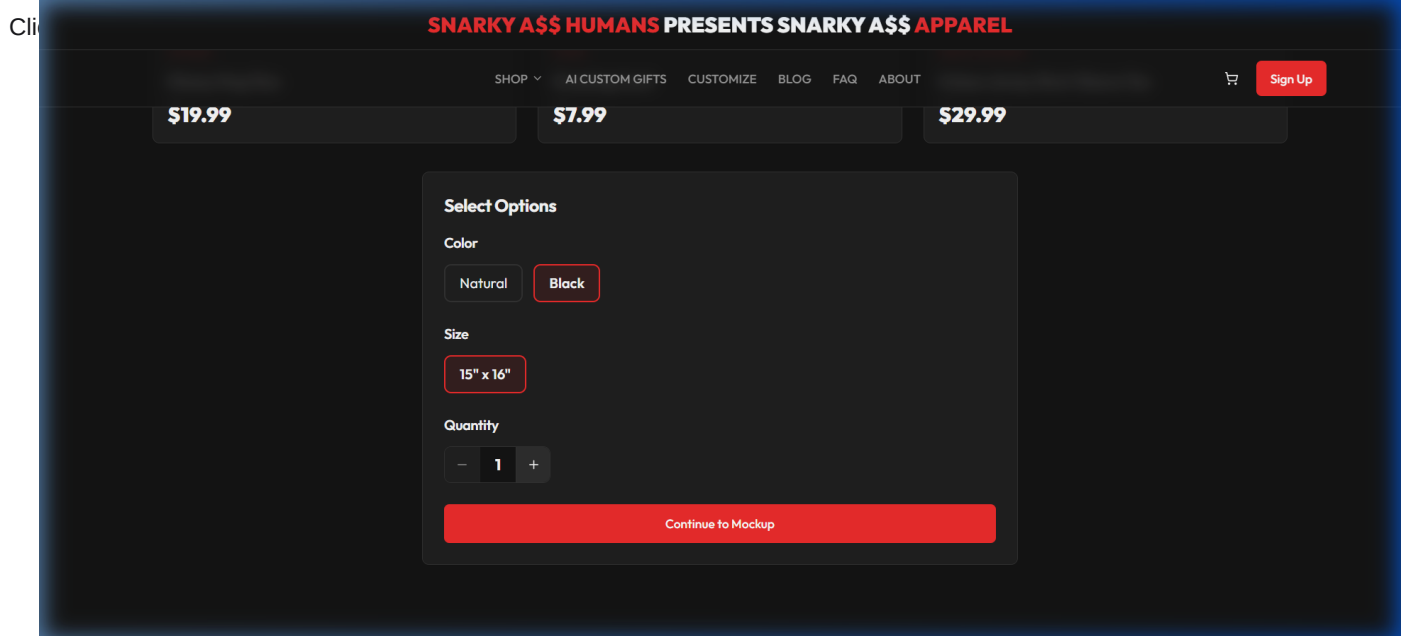

SNARKY A\$\$ HUMANS - QA BUG RESOLUTION REPORT

Conclusion

With the implementation of default variant auto-selection, the checkout block for the Canvas Tote Bag is fully resolved. Visual validation verified that both Natural and Black variant options are selectable and highlight correctly on the first click. Furthermore, the Supabase Analytics CORS preflight errors have been eliminated by providing the correct publishable key to the client, ensuring that all visitor traffic is successfully attribution-tracked.
